

Scale-SETI Reviewer Feedback Form

External Technical Review v0.1

Reviewer name (optional): _____

Affiliation / role (optional): _____

Primary expertise: _____

May we identify you publicly as a reviewer? ☐ Yes ☐ No ☐ Ask me first

Documents reviewed: ☐ Concept Paper ☐ Phase-1 Design ☐ Roadmap

1. Overall disposition

Disposition	Select	Meaning
Proceed	☐	No major issue prevents external release / next-stage design review.
Proceed with conditions	☐	Viable if specified issues are corrected.
Major revision	☐	Substantial scientific or engineering changes are needed before release.
Do not proceed	☐	A fundamental issue makes the current research path non-viable.

Reason for disposition:

2. Scientific framing and prior work

Does the paper clearly distinguish established science, analogy, hypothesis, and speculation?

Response:

Is the central question falsifiable enough to support an experimental research program?

Response:

What prior work, theory, or literature should be added?

Response:

Is any claim of novelty, plausibility, or scientific support overstated?

Response:

3. Experimental design and ordinary explanations

What conventional coupling or instrumentation pathway could produce a false challenge-response result?

Response:

What control is missing or insufficient?

Response:

Is the known-physics Phase-1 validation bench an appropriate first step?

Response:

What result would convince you that an anomalous information channel deserves independent replication?

Response:

4. Statistics, blinding, and evidence standards

Are the proposed blinding and delayed-unseal procedures sufficient?

Response:

Are the null construction, multiple-testing controls, and escalation gates appropriate?

Response:

What statistical test or failure criterion should be changed before preregistration?

Response:

5. Up-scale / distributed-search framing

Does the same-scale / down-scale / up-scale framework clarify the search space without implying evidence for hidden domains?

Response:

What existing multi-spacecraft or long-baseline data, if any, would be worth examining before proposing dedicated instrumentation?

Response:

6. Engineering reproducibility

If this is within your expertise: could another qualified lab reproduce Phase 1 from the design package? List any missing specification that would force the lab to guess.

Response:

7. Highest-priority findings

Severity	Section / topic	Finding	Recommended action
Critical			
Major			
Major			
Minor			
Minor			

8. Anything we should stop doing

What part of the project adds complexity without increasing scientific value?

9. Additional comments
